A: This was by design. In the first stage, it's just a "learning" system. After 30 days of not visiting site, the bot gets worse. What you need to do is to request the warning for your IP address. Once you get it, you just need to clear cookies and cache. The present invention relates generally to systems and methods for securing payment cards for access to digital content, and in particular, to systems and methods for securing payment card data using biometric information. Many people now use portable electronic devices, such as wireless telephones, smart phones, and personal digital assistants ("PDAs"), as an integral part of their daily lives. In fact, many people use their portable electronic devices as a primary source of information and communication, such as via email, instant messaging, online news, mapping, calendar, and music, for example. In addition, many people use portable electronic devices to keep track of personal information, such as financial information, medical

records, and contact information, for example. However, in many instances, there is a lack of security measures to protect the payment information of the user of the portable electronic device. Thus, it would be desirable to improve the security of payment information of users of portable electronic devices. In addition, many companies now offer services to provide digital content and access to digital content to customers over the Internet. Such digital content may include audio files, video files, multimedia files, games, and other types of content that may be electronically distributed. However, in many instances, there is a lack of security measures to protect the payment information of customers. Thus, it would be desirable to improve the security of payment information of customers of companies that offer digital content and access to digital content to customers. Thus, systems and methods are needed for securing payment cards for access to digital content that overcome the limitations of existing systems and methods.

Q: Double Fourier transform of $f(x,y)=\phi(x)\phi(y)$ I am trying to find the Fourier transform of $f(x,y)=\phi(x)\phi(y)$ where ϕ is the Fourier transform of the Lorentz distribution. I know the answer but I don't know how to get there. I tried using Parseval's theorem, but I don't know if it is correct. I also thought of using the fact that
